Virological Surveillance Summary

The total number of specimens and number of positive specimens reported to FluNet by Western Pacific Region countries and areas between week 1 and week 19 of 2023 are presented in Table 1 below. Influenza A and B are co-circulating, however, the majority of cases reported to week 19 of 2023 have been Influenza A(H1N1)pdm09 (Figure 1). Caution should be taken when interpreting these data as there are reporting delays.

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient indicator-based surveillance (IBS) systems, as well as event-based surveillance. Case definitions, population groups included and data formats differ among countries. This influenza surveillance summary includes countries and areas where routine IBS is conducted and information is available. The WHO surveillance case definition for influenza-like illness (ILI) is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an
Influenza Situation Update

acute respiratory infection (ARI) with a history of fever or measured fever of ≥38°C and cough, with symptom onset within 10 days that requires hospitalization. Sentinel site data should be interpreted with caution since the number of sites reporting may vary between weeks.

Countries in the temperate zone of the Northern Hemisphere

In countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity are similar to the corresponding period from previous years.

Outpatient ILI Surveillance

China (North)
During week 19 of 2023, sentinel hospitals in the northern provinces reported ILI% of 3.4%, lower than the last week (3.5%), and higher than the same week of 2020-2022 (1.9%, 2.4%, and 1.6%) (Figure 2).

![Figure 2: Percentage of visits for ILI at sentinel hospitals in northern China, 2020-2023](Source: China National Influenza Center)

Mongolia
During week 19 of 2023, the ILI activity in Mongolia decreased to 39 ILI cases per 10,000 population. This is above the upper tolerance limit (Figure 3).

![Figure 3: Proportion of outpatient ILI visits per 10,000 people in Mongolia, 2020-2023](Source: Mongolia National Influenza Center)
**Republic of Korea**

In week 19 2023, the overall weekly influenza-like illness (ILI) rate was 23.4% per 1,000 outpatient visits, which was lower than 23.7‰ recorded in the previous week (Figure 4).

**Figure 4**: Weekly ILI incidence rate per 1,000 outpatient consultations, Republic of Korea, 2018-2023  
(Source: Korea Disease Control and Prevention Agency)

**Sentinel influenza surveillance**

**Japan**

In week 19 of 2023, the number of cases reported weekly by sentinel hospital sites remained low in Japan. The number of cases in 2023 was consistently low (Figure 5).

(Source: Japan National Institute of Infectious Diseases)
Countries/areas in the tropical zone

ILI and influenza activity is similar to the corresponding period from previous years in some of the countries and areas in the tropical zone.

Hong Kong SAR (China) – ILI and hospital Surveillance

The latest surveillance data showed a decreasing trend in the overall seasonal influenza activity. In week 19, the average consultation rate for influenza-like illness (ILI) among sentinel general outpatient clinics (GOPC) was 3.4 ILI cases per 1,000 consultations, which was lower than 3.8 recorded in the previous week (Figure 6). The average consultation rate for ILI among sentinel private medical practitioner (PMP) clinics was 45.5 ILI cases per 1,000 consultations, which was lower than 56.8 recorded in the previous week (Figure 7).

China (South) - ILI Surveillance

During week 19, the percentage of outpatient or emergency visits for ILI (ILI%) at national sentinel hospitals in southern provinces was 6.7%, higher than the last week (6.3%), and higher than the same week of 2020-2022 (2.7%, 3.7%, and 3.0%) (Figure 8).

(Source: China National Influenza Center)
Singapore – Acute Respiratory Infection (ARI) Surveillance

In week 19 of 2023, the average daily number of patients seeking treatment in the polyclinics for ARI is 2,631 (over 5.5 working days) (Figure 9). The proportion of patients with influenza-like illness (ILI) among the polyclinic attendances for ARI is 0.5. The overall positivity rate for influenza among ILI samples (n= 1,365) in the community was 17.4% in the past 4 weeks. Of the 288 specimens tested positive for influenza in April 2023, 199 were positive for Influenza A(H3N2) (69.1%), 57 were positive for Influenza A(pH1N1) (19.8%), 1 was positive for Influenza A(LVT) (0.3%), and 31 were positive for Influenza B (10.8%) (Figure 10).

Lao PDR

During week 19 of 2023, the National Center for Laboratory and Epidemiology received data from all seven sentinel sites in Lao PDR. The number of ILI cases presenting at sentinel sites was 30 cases higher than the previous week. There were 81 samples tested for influenza in week 19, 2023. Influenza A/pdmH1N1 was identified (n=22) (Figure 11).
Cambodia

In week 19 of 2023, the Ministry of Health received data from all seven sentinel sites in Cambodia. The number of ILI cases in Cambodia slightly increased between week 18 (143 cases) and week 19 (152 cases) of 2023 (Figure 12). The positivity rate was 5.26% for this week.

Countries in the temperate zone of the southern hemisphere

In the temperate zone of the southern hemisphere, influenza activity is reported during the influenza season, usually starting in May in Australia and New Zealand.

Australia – Laboratory-confirmed influenza

In the year to 14 May 2023, there have been 40,138 notifications of laboratory-confirmed influenza reported to the National Notifiable Diseases Surveillance System in Australia. There were 8,173 laboratory-confirmed influenza notifications with a diagnosis date this fortnight (Monday 1 May to Sunday 14 May 2023), an increase compared to 6,159 notifications in the previous fortnight. From March 2023 the number of notifications of laboratory-confirmed influenza has gradually increased. The number of notifications year-to-date is higher than the 5-year average, but lower than observed in the same period in 2019 (Figure 13).

![Figure 13: Notifications of laboratory-confirmed influenza by month and week from 2016 to 2023 in Australia](image)

(Source: National Notifiable Diseases Surveillance System, Australian Department of Health)
New Zealand – Influenza like Illness

In the week ending on 14 May 2023, the influenza like illness (ILI) general practitioner consultation (Figure 14) rates increased compared to the previous week. National influenza-like illness (ILI) activity in the community increased in the week ending 14 but remains at expected low levels for this time of year. However, in Counties Manukau and Lakes, ILI activity is above the national rate.

(Source: New Zealand Institute of Environmental Science and Research)

Pacific Island Countries and Areas (PICs) - ILI Surveillance

In week 19 of 2023, 18 out of 21 PICs reported ILI surveillance data. Only 15 out of 18 PICS reported updated data. No reports are available for American Samoa, Guam, and Nauru, and no updates from French Polynesia, Tokelau, and Tuvalu. The following countries reported increased influenza-like illness activity: Fiji, Tuvalu, and Vanuatu (Figure 15).
