Influenza Situation Update  
30 August 2023

Virological Surveillance Summary

The total number of specimens and number of positive specimens reported to FluNet by Western Pacific Region countries and areas between week 1 and week 33 of 2023 are presented in Table 1 below. Influenza A and B are co-circulating, however, the majority of cases reported to week 33 of 2023 have been Influenza A (Figure 1). Caution should be taken when interpreting this data as there are reporting delays.

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient indicator-based surveillance (IBS) systems, as well as event-based surveillance. Case definitions, population groups included and data formats differ among countries. This influenza surveillance summary includes countries and areas where routine IBS is conducted and information is available.

The WHO surveillance case definition for influenza-like illness (ILI) is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an acute respiratory infection (ARI) with a history of fever or measured fever of ≥38°C and cough, with symptom onset within 10 days that requires hospitalization. Sentinel site data should be interpreted with caution since the number of sites reporting may vary between weeks.
Countries in the temperate zone of the Northern Hemisphere

In countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity are similar to the corresponding period from previous years.

Outpatient ILI Surveillance

China (North)
During week 33 of 2023, sentinel hospitals in the northern provinces reported ILI% of 2.7%, lower than the last week (2.8%), and higher than the same week of 2020-2022 (1.9%, 2.0%, and 2.5%) (Figure 2).

Mongolia
During week 33 of 2023, the ILI activity in Mongolia decreased to 15 ILI cases per 10,000 population. This is below the upper tolerance limit (Figure 3).

(Source: China National Influenza Center)

Figure 3: Proportion of outpatient ILI visits per 10,000 people in Mongolia, 2020-2023
(Source: Mongolia National Influenza Center)
**Republic of Korea**

In week 33 of 2023, the overall weekly influenza-like illness (ILI) rate was 12.0 per 1,000 outpatient visits, which was lower than the rate recorded in the previous weeks (14.1 on week 31 and 12.5 on week 32) (Figure 4).

![Figure 4: Weekly ILI incidence rate per 1,000 outpatient consultations, Republic of Korea, 2018-2023](Source: Korea Disease Control and Prevention Agency)

**Sentinel influenza surveillance**

**Japan**

In week 32 of 2023, the number of cases reported weekly by sentinel hospital sites remained low in Japan. The number of cases in 2023 has been consistently low (Figure 5).

![Figure 5: Number of influenza cases reported weekly per reporting sentinel hospital site, Japan 2013-2023](Source: Japan National Institute of Infectious Diseases)
Countries/areas in the tropical zone

ILI and influenza activity is similar to the corresponding period from previous years in some of the countries and areas in the tropical zone.

Hong Kong SAR (China) – ILI and hospital Surveillance

The latest surveillance data showed an increase in the overall seasonal influenza activity. In week 33, the average consultation rate for influenza-like illness (ILI) among sentinel general outpatient clinics (GOPC) was 4.2 ILI cases per 1,000 consultations, which was higher than 3.8 recorded in the previous week (Figure 6). The average consultation rate for ILI among sentinel private medical practitioner (PMP) clinics was 32.8 ILI cases per 1,000 consultations, which was higher than 14.0 recorded in the previous week (Figure 7).

China (South) - ILI Surveillance

During week 33, the percentage of outpatient or emergency visits for ILI (ILI%) at national sentinel hospitals in southern provinces was 4.1%, lower than the last week (4.3%), and higher than the same week in 2020-2022 (2.7%, 2.8% and 3.3%) (4.1%) (Figure 8).

(Source: China National Influenza Center)
Singapore – Acute Respiratory Infection (ARI) Surveillance
In week 33 of 2023, the average daily number of patients seeking treatment in the polyclinics for ARI is 2,377 (over 5.5 working days) (Figure 9). The proportion of patients with influenza-like illness (ILI) among the polyclinic attendances for ARI is 0.5%. The overall positivity rate for influenza among ILI samples (n= 1,124) in the community was 28.2% in the past 4 weeks. Of the 297 specimens tested positive for influenza in July 2023, 189 were positive for Influenza A(H3N2) (63.7%), 82 were positive for Influenza A(pH1N1) (27.6%), and one was positive for Influenza A(LVT) (0.3%), and 25 were positive for Influenza B (8.4%) (Figure 10).

(Source: Singapore Ministry of Health)

Lao PDR
During week 33 of 2023, the National Center for Laboratory and Epidemiology received data from all seven sentinel sites in Lao PDR. The number of ILI cases presenting at sentinel sites was 72 cases higher than the previous week. There were 115 samples tested for influenza in week 33, 2023. Influenza A/pdmH1N1 (n=1) and Flu A/H3 (n=1) were identified. (Figure 11).

Figure 11: Weekly number of ILI cases at sentinel sites (2019 to 2023)
(Source: Lao National Center for Laboratory and Epidemiology)
Cambodia

In week 33 of 2023, the Ministry of Health received data from 7 sentinel sites in Cambodia. During this period, the number of ILI cases in Cambodia remains stable between week 32 (183 cases) and week 33 (166 cases) of 2023, and the positivity rate for week 33 is 27.7% (Figure 12). The proportion of weekly influenza positive samples fluctuated in 2023.

Countries in the temperate zone of the southern hemisphere

In the temperate zone of the southern hemisphere, influenza activity is reported during the influenza season, usually starting in May in Australia and New Zealand.

Australia – Laboratory-confirmed influenza

In the year-to-date (1 January to 20 August 2023), there have been 211,491 notifications of laboratory-confirmed influenza reported to the National Notifiable Diseases Surveillance System in Australia. There were 14,287 laboratory-confirmed influenza notifications with a diagnosis date this fortnight (Monday 7 August to Sunday 20 August 2023), compared to 18,542 notifications in the previous fortnight. From March 2023, the number of notifications of laboratory-confirmed influenza had gradually increased, but it has significantly decreased after the peak in July. The number of notifications year-to-date is lower than the 5-year average. (Figure 13).

Figure 13: Notifications of laboratory-confirmed influenza by month and week from 2016 to 2023 in Australia

(Source: National Notifiable Diseases Surveillance System, Australian Department of Health)
New Zealand – ILI Surveillance
In the week ending on 20 August 2023, weekly general practitioner ILI consultation rates decreased slightly compared to the previous week (14.93 per 100,000 compared to 14.97 per 100,000) (Figure 14). The national rate is higher than that observed at this time in 2022 but lower than the 2015-2019 period. Influenza B and A(H1N1) continue to be the most detected viruses in the community in recent weeks.

(Source: New Zealand Institute of Environmental Science and Research)

Pacific Island Countries and Areas (PICs) - ILI Surveillance
There have been no updates since the previous report. In week 31 of 2023, 18 out of 21 PICs reported ILI surveillance data. 16 out of 18 PICs reported updated data since week 25. No reports are available for American Samoa, Guam, and Nauru. The following countries reported increased influenza-like illness activity in week 27-31 compared to the previous weeks: Fiji, Palau, Tonga and Vanuatu. (Figure 15).
