**Human infection with avian influenza A(H5) viruses**

**Human infection with avian influenza A(H5N1) virus**

Between 5 January 2024 and 11 January 2024, no new case of human infection with avian influenza A(H5N1) virus was reported to WHO in the Western Pacific Region.

From 1 January 2003 to 21 December 2023, a total of 248 cases of human infection with avian influenza A(H5N1) virus have been reported from four countries within the Western Pacific Region (Table 1). Of these cases, 139 were fatal, resulting in a case fatality rate (CFR) of 56%. The last cases in the Western Pacific Region were reported from Cambodia on 24 and 25 November 2023.

**Table 1: Cumulative number of laboratory-confirmed human cases (C) and deaths (D) of influenza A(H5N1) virus infection reported to WHO, by date of onset (1 January 2003 to 21 December 2023), Western Pacific Region**

NB: This table is updated on a monthly basis following the updates from the [Source](#).

Globally, from 1 January 2003 to 21 December 2023, 882 cases of human infection with avian influenza A(H5N1) virus were reported from 23 countries. Of these 882 cases, 461 were fatal (CFR of 52%) [Source](#).

**Human infection with avian influenza A(H5N6) virus**

Between 5 January 2024 and 11 January 2024, 1 new case of human infection with avian influenza A(H5N6) virus was reported to WHO in the Western Pacific Region. To date, a total of 90 laboratory-confirmed cases of human infection with influenza A(H5N6) virus including 35 deaths (CFR 39%) have been reported to WHO in the Western Pacific Region since 2014. The last case was reported from China, with an onset date of 25 November 2023.

**Human infection with avian influenza A(H5) virus**

Between 5 January 2024 and 11 January 2024, no new case of human infection with avian influenza A(H5) virus was reported to WHO in the Western Pacific Region. The last case was reported from Viet Nam, with an onset date of 22 October 2022 (one case, no death). This was the first case of avian influenza A(H5) reported from Viet Nam since 2014; NA subtype could not be determined.

**Public health risk assessment for human infection with avian influenza A(H5) viruses**

Whenever avian influenza viruses are circulating in poultry, there is a risk for sporadic infection and small clusters of human cases due to exposure to infected poultry or contaminated environments. Therefore, sporadic human cases are not unexpected.
The rise in the number of reported human cases of A(H5N6) infection may reflect the continued circulation of the virus in birds, and enhanced surveillance system and diagnostic capacity as a direct outcome of the response to the COVID-19 pandemic. The zoonotic threat remains elevated due to the spread of the viruses among birds. However, the overall pandemic risk associated with A(H5) is considered not significantly changed in comparison to previous years. WHO recommends that Member States remain vigilant and consider mitigation steps to reduce human exposure to potentially infected birds to reduce the risk of additional zoonotic infection.

For information on risk assessments on Avian Influenza, see: monthly risk assessment summaries and Assessment of risk associated with highly pathogenic avian influenza A(H5N6) virus.

Human infection with avian influenza A(H3N8) virus
Between 5 January 2024 and 11 January 2024, no new case of human infection with avian influenza A(H3N8) virus was reported to WHO in the Western Pacific Region. The last case was reported from China with an onset of illness of 22 February 2023. To date, a total of three laboratory-confirmed cases of human infection with influenza A(H3N8) virus with one death have been reported to WHO in the Western Pacific Region.

Human infection with avian influenza A(H7N4) virus in China
Between 5 January 2024 and 11 January 2024, no new case of human infection with avian influenza A(H7N4) virus was reported to WHO in the Western Pacific Region. To date, only one laboratory-confirmed case of human infection with influenza A(H7N4) virus has been reported to WHO. This case was reported from China on 14 February 2018.

Human infection with avian influenza A(H7N9) virus in China
Between 5 January 2024 and 11 January 2024, no new case of human infection with avian influenza A(H7N9) virus was reported to WHO in the Western Pacific Region. To date, a total of 1568 laboratory-confirmed human infections with avian influenza A(H7N9) virus, including 616 fatal cases (CFR: 39%), have been reported to WHO since early 2013. The last case of human infection with avian influenza A(H7N9) reported to WHO in the Western Pacific Region was in 2019.

Of the 1568 human infections with avian influenza A(H7N9), 33 have reported mutations in the hemagglutinin gene indicating a change to high pathogenicity in poultry. These 33 cases were from Taiwan, China (one case had a travel history to Guangdong), Guangxi, Guangdong, Hunan, Shaanxi, Hebei, Henan, Fujian, Yunnan, and Inner Mongolia. No increased transmissibility or virulence of the virus within human cases related to the HPAI A(H7N9) virus has been detected.

Human infection with avian influenza A(H9N2) virus
Between 5 January 2024 and 11 January 2024, no new case of human infection with avian influenza A(H9N2) virus was reported to WHO in the Western Pacific Region.

To date, a total of 94 cases of human infection with avian influenza A(H9N2), including two deaths (both with underlying conditions), have been reported to WHO in the Western Pacific Region since December 2015. Of these, 92 were reported from China and two were reported from Cambodia. The last two cases were reported from Sichuan Province, China, with onset dates of 5 November 2023 and 14 November 2023, respectively.
Human infection with avian influenza A(H10N3) virus

Between 5 January 2024 and 11 January 2024, no new case of human infection with avian influenza A(H10N3) virus was reported to WHO in the Western Pacific Region. To date, two cases of avian influenza A(H10N3) virus have been reported globally. The last case was reported from Zhejiang, China with an onset date of 11 June 2022.

Most previously reported human infections with avian influenza viruses were due to exposure to infected poultry or contaminated environments. Since avian influenza viruses, including avian influenza A(H10N3) viruses, continue to be detected in poultry populations, further sporadic human cases could be detected in the future. Currently, available epidemiologic information suggests that the avian influenza A(H10N3) virus has not acquired the ability for sustained human-to-human transmission, thus the likelihood of spread among humans is low.

Animal infection with avian influenza virus

Between 5 January 2024 and 11 January 2024, there are 16 reports of high pathogenicity avian influenza among birds reported to the World Organization for Animal Health WOAH from the Western Pacific Region.

In Cambodia, 3 new outbreaks of highly pathogenic avian influenza A(H5N1) were reported in poultry in Prey Veng and Siemreab with 783 cases and 405 deaths (source).

In Japan, 3 new outbreaks of highly pathogenic avian influenza A(H5N1) were reported including one death in a wild bird in Kagoshima, and 244 cases and 244 deaths in domestic poultry in Yamagata and Takayama (source 1, source 2). Additionally, a new outbreak of highly pathogenic avian influenza A(H5N5) was reported from Erimo including one death in a wild bird (source).

In Republic of Korea, 2 new outbreaks of highly pathogenic avian influenza A(H5N1) were reported in domestic birds in Jeollanam-do with 220 cases and 11 deaths (source). Additionally, 5 new outbreaks of highly pathogenic avian influenza A (H5N6) were reported from the Republic of Korea including 3 outbreaks from Jeollabuk-do and Jeollanam-do with 220 cases and 16 deaths in domestic birds, and 2 outbreaks from Jeollabuk-do and Gyeongsangbuk-do with 4 cases and 3 deaths in wild birds (source 1, source 2).

In Hong Kong, 2 new outbreaks of highly pathogenic avian influenza A(H5N1) were reported in Tai Po and Tin Shui Wai with 2 cases, 2 deaths in wild birds (source).

Control measures such as disinfection and enhanced surveillance have been taken at the outbreak places.
