Virological Surveillance Summary

The total number of specimens and number of positive specimens reported to FluNet by Western Pacific Region countries and areas between week 1 and week 9 of 2024 are presented in Table 1 below. Influenza A and B are co-circulating, however, the majority of cases reported in week 1 to week 9 of 2024 have been Influenza B (Victoria) (Figure 1). Caution should be taken when interpreting this data as there are reporting delays.

Influenza surveillance summary

Influenza surveillance in the WHO Western Pacific Region is based on outpatient and inpatient indicator-based surveillance (IBS) systems, as well as event-based surveillance. Case definitions, population groups included and data formats differ among countries. This influenza surveillance summary includes countries and areas where routine IBS is conducted and information is available.

The WHO surveillance case definition for influenza-like illness (ILI) is an acute respiratory infection with a measured fever of ≥38°C and cough, with symptom onset within the last 10 days. For SARI, it is an
acute respiratory infection (ARI) with a history of fever or measured fever of ≥38°C and cough, with symptom onset within 10 days that requires hospitalization.

Sentinel site data should be interpreted with caution since the number of sites reporting may vary between weeks.

**Countries in the temperate zone of the Northern Hemisphere**

In countries within the temperate zone of the Northern Hemisphere, ILI and influenza activity are similar to the corresponding period from previous years.

**Outpatient ILI Surveillance**

**China (North)**

During week 9, sentinel hospitals in the northern provinces reported ILI% of 4.3%, which is the same as the last week (4.3%), higher than the same week of 2021-2022 (1.6% and 2.2%), lower than the same week of 2023 (7.4%) (Figure 2).

![Figure 2: Percentage of visits for ILI at sentinel hospitals in northern China, 2020-2024 (as of week 9)](source)
Mongolia
There was no update in this reporting period. During week 45 of 2023, the ILI activity in Mongolia increased to 38 ILI cases per 10,000 population. This is above the upper tolerance limit (Figure 3).

Figure 3: Proportion of outpatient ILI visits per 10,000 people in Mongolia, 2021 (from week 16-49) -2023 (as of week 45)
(Source: Mongolia National Influenza Center)

Republic of Korea
In week 9 (25 February to 2 March 2024), the overall weekly influenza-like illness (ILI) rate was 14.8 per 1,000 outpatient visits, which was lower than the rate recorded in the previous weeks (17.9 in week 8) (Figure 4).

Figure 4: Weekly ILI incidence rate per 1,000 outpatient consultations, Republic of Korea, 2019 (from week 36-52)-2024 (as of week 9)
(Source: Korea Disease Control and Prevention Agency).
Sentinel influenza surveillance

Japan
In week 9 of 2024, the weekly number of cases reported by sentinel hospital sites in Japan slightly decreased compared to the previous week. (Figure 5).

Countries/areas in the tropical zone
ILI and influenza activity is similar to the corresponding period from previous years in some of the countries and areas in the tropical zone.

Hong Kong SAR (China) – ILI and hospital Surveillance
In week 9, the average consultation rate for influenza-like illness (ILI) among sentinel general outpatient clinics (GOPC) was 8.8 ILI cases per 1,000 consultations, which was lower than 10.7 recorded in the previous week (Figure 6). The average consultation rate for ILI among sentinel private medical practitioner (PMP) clinics was 37.2 ILI cases per 1,000 consultations, which was lower than 49.2 recorded in the previous week (Figure 7).
China (South) - ILI Surveillance
During week 9, the percentage of outpatient or emergency visits for ILI (ILI%) at national sentinel hospitals in southern provinces was 5.0%, lower than the last week (5.6%), higher than the same week in 2021 - 2022 (2.2% and 3.8%), lower than the same week of 2023 (7.5%) (Figure 8).

Figure 8: Percentage of visits due to ILI at national sentinel hospitals in Southern China, 2020-2024
(Source: China National Influenza Center)

Singapore – Acute Respiratory Infection (ARI) Surveillance
In week 9 (25 February to 2 March 2024), the average daily number of patients seeking treatment in the polyclinics for ARI is 2,335 (over 5.5 working days) (Figure 9). The proportion of patients with influenza-like illness (ILI) among the polyclinic attendances for ARI is 0.5%. The overall positivity rate for influenza among ILI samples (n=370) in the community was 27.8% in week 9. Of the 399 specimens tested positive for influenza in February 2024, 135 were positive for Influenza A(H3N2) (34%), 57 were positive for Influenza A(pH1N1) (14%), and 207 were positive for Influenza B (52%) (Figure 10).

Lao PDR
During week 9 (26 February to 3 March 2024), the National Center for Laboratory and Epidemiology received data from all sentinel sites in Lao PDR. The number of ILI cases presenting at sentinel sites slightly increased compared to the previous week (Figure 11). There were 113 samples tested for influenza in week 9 of 2024, of which 10 positive: Influenza A/pdmH1N1 (n=1), Influenza A/H3 (n=2), and Influenza B-Victoria (n=7).

**Cambodia**

In week 9 of 2024, the Ministry of Health received data from all seven sentinel sites in Cambodia. The number of ILI cases in Cambodia has slightly increased in week 9 (193 cases) compared to week 8 (178 cases). However, the positivity rate slightly decreased from 21% in week 8 to 7% in week 9 (Figure 12).

*Note: Starting from week 2 of 2024, the ILI surveillance has been updated as follows: a) Changed case definitions of ILI from >38°C (greater than 38) to ≥ 38°C (greater and equal to 38), b) Increasing number of samples per sentinel sites from 5 to 10 per week. Therefore, the number of cases and positivity might also increase.*

**Countries in the temperate zone of the southern hemisphere**
In the temperate zone of the southern hemisphere, influenza activity is reported during the influenza season, usually starting in May in Australia and New Zealand.

**Australia – Laboratory-confirmed influenza**

There is no update for this reporting period. In the year-to-date (1 January to 15 October 2023), there have been 251,095 notifications of laboratory-confirmed influenza reported to the National Notifiable Diseases Surveillance System in Australia. There were 6,037 laboratory-confirmed influenza notifications with a diagnosis date this fortnight (2 October to 15 October 2023), compared to 7,725 notifications in the previous fortnight. The number of notifications of laboratory confirmed influenza has continued to decrease since the peak in July (Figure 13).

![Figure 13: Notifications of laboratory-confirmed influenza by month and week from 2016 to 2023 in Australia](Source: National Notifiable Diseases Surveillance System, Australian Department of Health)

**New Zealand – ILI Surveillance**

Indicators of influenza-like illness in the community remain low. The rate of ILI related Healthline calls decreased in the second week of February but have increased over the past two weeks. ILI related calls to healthline are currently below the rates seen at the same time in 2023. The percentage of FluTracking participants with fever and cough has been increasing since the end of January and is slightly above the percentage seen at the same time in 2023 (Figure 14).

Pacific Island Countries and Areas (PICs) - ILI Surveillance

In week 9 (26 February to 3 March 2024), 18 out of 21 PICs reported ILI surveillance data. No reports are available for American Samoa, Guam and Nauru. Cook Islands, Fiji, Micronesia (Federated States of), New Caledonia, Northern Mariana Islands, Samoa, Tonga, and Wallis and Futuna observed a slight increase in ILI trend compared to the past week (Figure 15).
